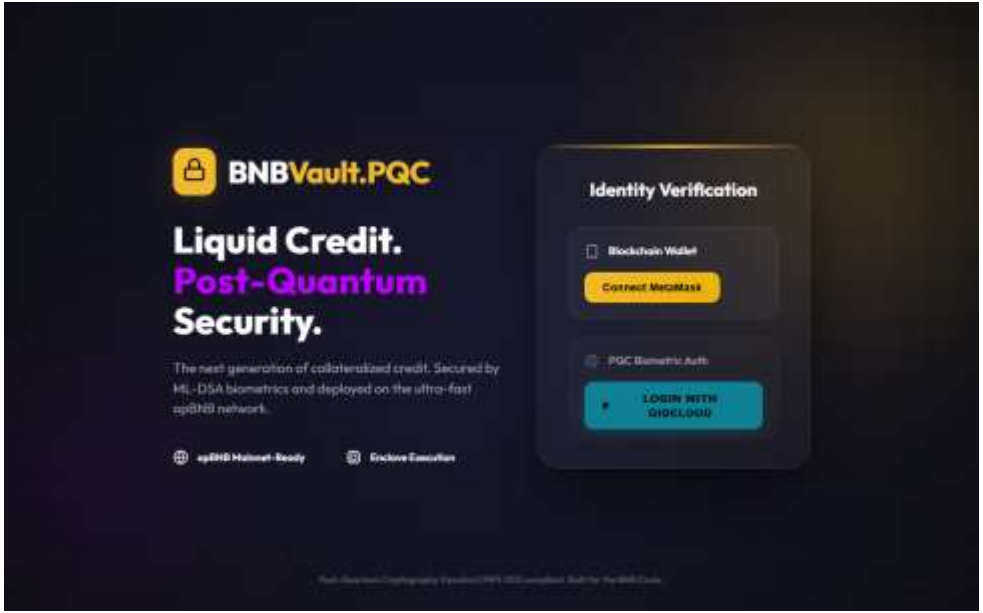
BNB Collateral Credit System - App Showcase

opBNB, Greenfield & QidCloud Integration

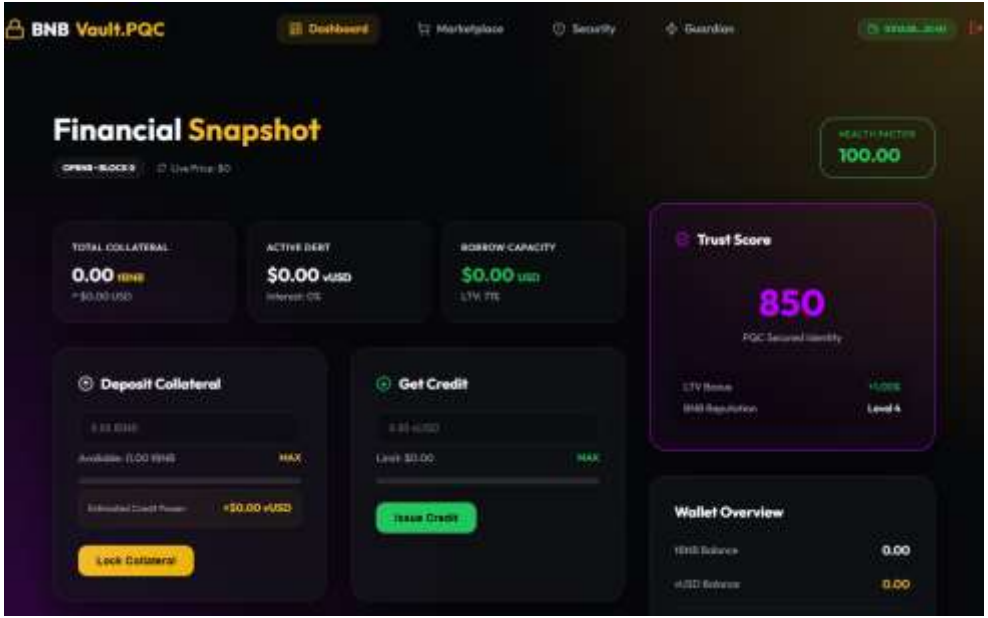
Login & PQC Auth

Users securely access the decentralized application using a combination of their Web3 wallet and Post-Quantum Cryptography (ML-DSA-65) biometric authentication. This ensures that only verified owners can enter the high-stakes financial enclave, protecting against future quantum computer threats.



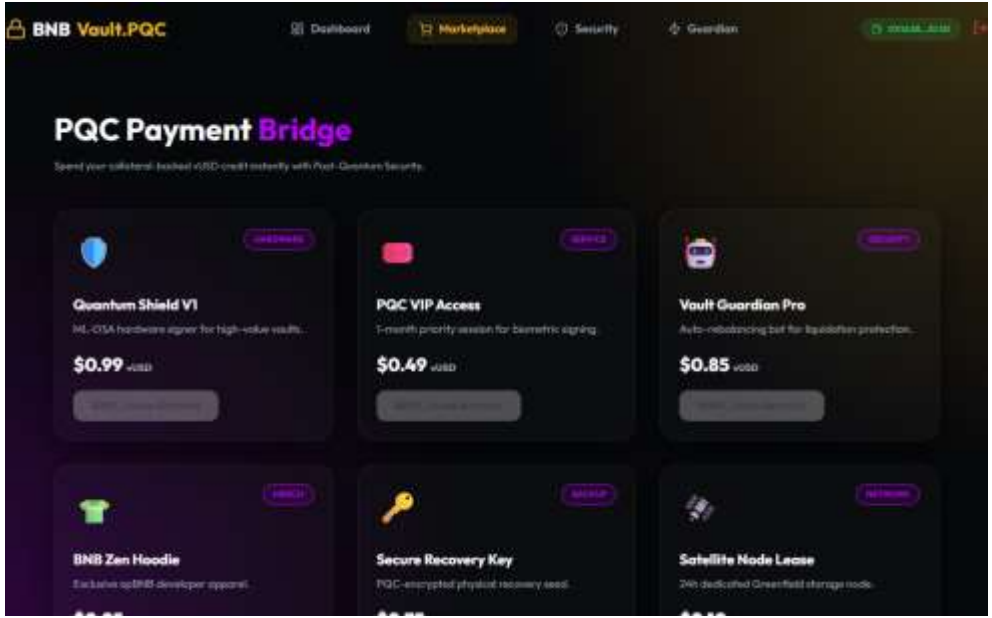
Dashboard & Portfolio

The main dashboard provides a real-time overview of the user’s collateral, borrowing capacity, and health factor. Live price feeds from the Binance API ensure that wallet health and liquidation thresholds are constantly synchronized with global market conditions.



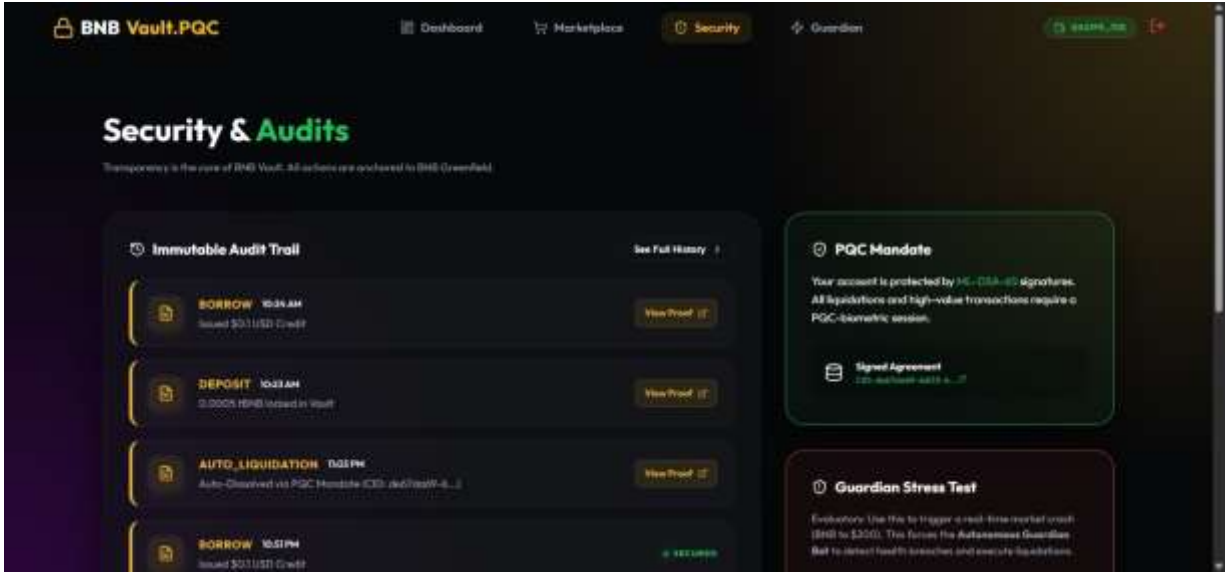
Marketplace & BNPL

An integrated Buy Now, Pay Later (BNPL) marketplace allows users to seamlessly spend their collateral-backed credit on real-world or digital items. The system automatically computes point-of-sale borrowing parameters without forcing users to jump between different DeFi protocols.



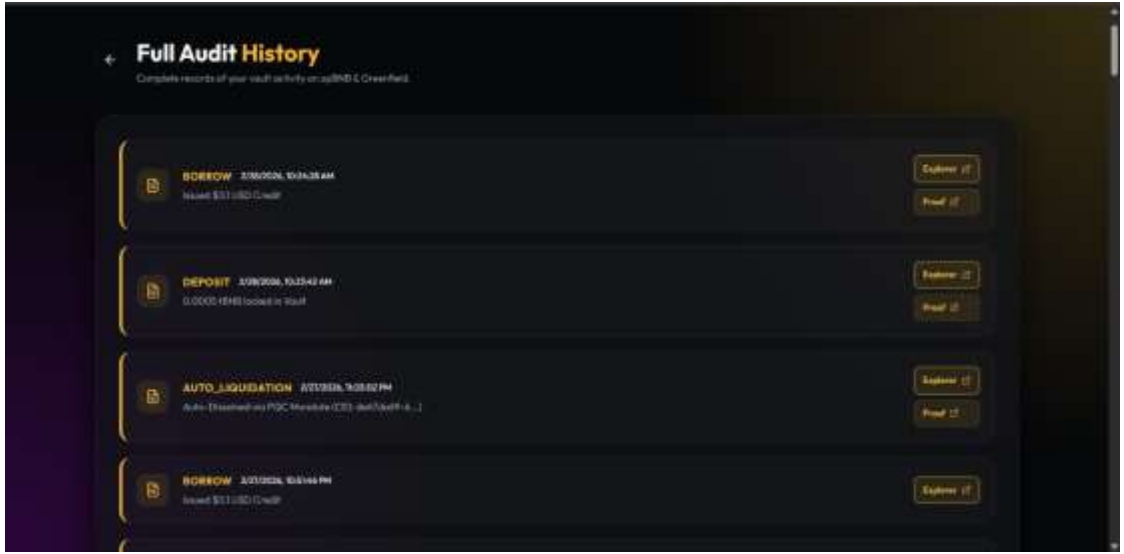
Security Enclave

This dedicated security hub showcases user trust, history, and active session mandates. It visually confirms that the current session is actively signed by QidCloud Enclave signatures before permitting high-value withdrawals or profile changes.



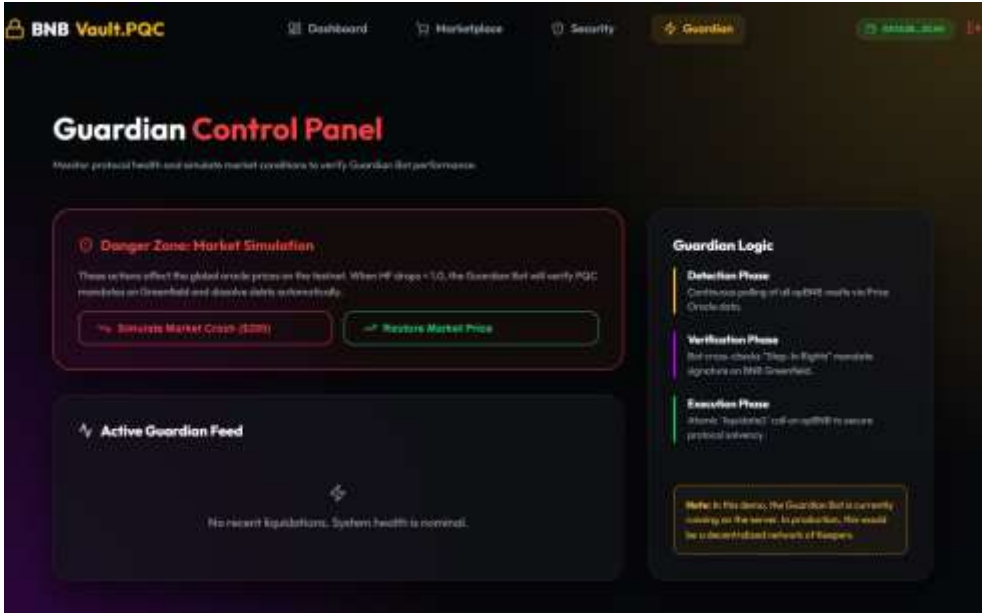
Audit Logs (Greenfield)

Every critical protocol action, liquidation, and high-value loan is anchored to BNB Greenfield decentralized storage. This creates an immutable, tamper-proof proof-of-state log, providing absolute transparency to all ecosystem participants.



Guardian AI & Liquidation

The Guardian Bot operates as a fast, autonomous agent that constantly monitors vault health. During flash crashes or market volatility, it executes immediate, PQC-signed liquidation mandates to prevent systemic bad debt and keep the protocol solvent.



Thank you!
